

Why Health Care Reform is Important in Wisconsin

Health care reform is critical in Wisconsin as the population ages.

In 2008, the total population in Wisconsin was 5,597,312. Wisconsin has a significant older population who can be at greater risk for chronic illnesses: 13% of the population is age 65 and older and 19% is age 50-64.¹

Nearly 66,000 Wisconsinites age 50-64 are uninsured; many more are under-insured.

Too young for Medicare, but old enough to face higher insurance premiums, many 50-64 year olds have difficulty accessing affordable health care coverage. In 2007, there were 66,329 50-64 year olds in Wisconsin who were uninsured, and many with insurance were under-insured due to the high cost of coverage for this age group.² Additionally, about 11% of Wisconsinites age 19-64 are without health care insurance.³

Nearly one in six residents has Medicare.

In 2008, there were 871,111 Medicare beneficiaries in Wisconsin.⁴ In 2004, 87% of Wisconsin Medicare beneficiaries were age 65 and older and about 14% were eligible due to disabilities.⁵ Nationally, Medicare beneficiaries spend an average of nearly 30% of their income on health care costs.⁶

Nearly one in four Medicare beneficiaries falls into the Part D “doughnut hole.”

In 2007, of the Medicare beneficiaries in Wisconsin age 65 and older, 26% lived close enough to the poverty line to make them eligible for the Medicare Part D Low-Income Subsidy.⁷ Of those not eligible for the subsidy, 23% fell into “the doughnut hole,” or had to pay the full cost of their prescriptions for a portion of the year.⁸ In Wisconsin, that would be about 73,400 people who had to pay 100% of their prescription drug costs for at least part of the year, and this number is increasing each year.^{9,10}

Rehospitalizations are costly to Medicare and its beneficiaries.

Medicare spent \$12 billion nationally in 2005 on unnecessary or potentially preventable hospital readmissions.¹¹ In 2004, 17% of Wisconsin Medicare beneficiaries discharged from the hospital were re-admitted within 30 days.¹² Providing a follow-up benefit for Medicare beneficiaries could save billions and improve outcomes for patients.

Wisconsin spends most of the state’s Medicaid funds on institutional care.

Many older people and those with multiple chronic conditions and long-term care needs rely on Medicaid. Even though people prefer to remain at home, the state spends 72% of its Medicaid long-term care dollars for older people and adults with physical disabilities on nursing home care, and only 28% on home care services.¹³

Wisconsinites spend about the same amount on prescription drugs as the rest of the nation.

In 2007, Americans filled an average of 10 prescriptions at an average cost of \$53 per prescription. Wisconsin residents filled about 11 prescriptions a year at an average cost of \$49 per prescription.¹⁴ In 2005, about 57% of prescriptions for Wisconsin residents were filled with generics.¹⁵ If generic equivalents of biologic treatments were also available, Wisconsin residents could save millions of dollars each year.
